

Session 1 Quiz – Introduction to AI

Track B | Grades 9–12

Q1 [Type: MCQ | Difficulty: Easy | QID : 52004]

A computer system that can perform tasks typically requiring human intelligence — such as recognizing speech, making decisions, or identifying patterns — is broadly called _____.

- A. Database
- B. Spreadsheet
- C. Artificial Intelligence
- D. Browser

Correct Answer: Artificial Intelligence

Explanation: Artificial Intelligence (AI) refers to systems performing tasks that typically require human intelligence. Databases store data, spreadsheets organize numbers, and browsers display websites — none are AI by themselves.

Q2 [Type: MCQ | Difficulty: Easy | QID : 52005]

AI that is designed to perform a specific task – like translating languages or recommending videos – but cannot do other tasks beyond its design is called _____ AI.

- A. General
- B. Narrow
- C. Random
- D. Universal

Correct Answer: Narrow

Explanation: Narrow AI (sometimes called weak AI) handles specific tasks. Nearly all real-world AI today is narrow. General AI (or AGI) would handle any intellectual task a human can; it remains hypothetical.

Q3 [Type: MCQ | Difficulty: Easy | QID : 52014]

The early test proposed by Alan Turing to evaluate whether a machine could exhibit intelligent behavior indistinguishable from a human is called the _____ Test.

- A. Logic
- B. Speed
- C. Memory
- D. Turing

Correct Answer: Turing

Explanation: The Turing Test, proposed by Alan Turing in 1950, asked whether a machine could converse so well that a human couldn't tell it from another human. It's one of the foundational concepts in AI history.

Q4 [Type: MCQ | Difficulty: Easy | QID : 52015]

Most AI systems in widespread use today are narrow AI designed for specific tasks, not general AI capable of doing any task a human can.

A. True

B. False

Correct Answer: True

Explanation: Almost every deployed AI system today handles a specific task — translation, recommendation, image recognition, fraud detection. General AI (AGI) capable of doing anything a human can across domains remains a research goal, not a deployed reality.

Q5 [Type: MCQ | Difficulty: Easy | QID : 52016]

Every device that runs software, including a simple calculator, is considered AI.

A. True

B. False

Correct Answer: False

Explanation: A simple calculator follows hardcoded arithmetic rules; it doesn't learn from data or perform tasks requiring intelligence. Software alone doesn't make something AI — the system must perform tasks typically requiring human intelligence, usually by learning from data.

Q6 [Type: MCQ | Difficulty: Easy-Medium | QID : 52017]

Which is an example of AI in everyday life?

- A. A basic calculator that adds numbers
- B. A printed paper map of a city
- C. A traditional alarm clock with two bells
- D. A music streaming app that recommends songs based on what you've listened to

Correct Answer: D

Explanation: Music recommendation learns from your listening patterns – a clear AI application.

Q7 [Type: MCQ | Difficulty: Easy-Medium | QID : 52018]

What is the main difference between AI systems and traditional programmed software?

- A. AI systems can learn patterns from data; traditional software follows specific rules written by programmers
- B. AI systems run on better computers than traditional software
- C. Traditional software is more colorful than AI systems
- D. There is no difference between them

Correct Answer: A

Explanation: Traditional software follows rules a programmer wrote; AI systems learn patterns from data. This is the foundational distinction.

Q8 [Type: MCQ | Difficulty: Easy-Medium | QID : 52024]

Why is AI more prominent now than it was 30 years ago?

- A. Computers ran more slowly in the past
- B. People weren't interested in AI before
- C. AI was illegal until recently
- D. Data, computing power, and algorithms have improved dramatically.

Correct Answer: D

Explanation: The standard explanation for AI's recent prominence: big data + compute + algorithms came together.

Q9 [Type: MCQ | Difficulty: Medium | QID : 52026]

A general AI (or artificial general intelligence) would differ from today's AI systems because it would:

- A. Perform tasks across many domains, like a human
- B. Run faster than today's narrow AI
- C. Be available on more phones
- D. Be illegal under current laws

Correct Answer: A

Explanation: AGI would generalize across domains the way humans do. Today's narrow AI is highly capable in its specific domain but can't generalize.

Q10 [Type: MCQ | Difficulty: Medium | QID : 52028]

A student opens a learning app that adapts the practice problems shown based on which problems they got wrong in past sessions.

What kind of AI is this?

- A. General AI capable of all tasks
- B. Personalized recommendation AI – narrow AI applied to education
- C. Not actually AI; just a paper textbook
- D. Voice cloning

Correct Answer: B

Explanation: Adaptive learning is narrow AI focused on education.

Q11 [Type: MCQ | Difficulty: Medium | QID : 52058]

A medical clinic uses AI to scan x-ray images and flag suspicious findings for the radiologist's review.

What is the most accurate framing of the AI's role?

- A. The AI replaces radiologists entirely
- B. The AI guarantees no errors will be made
- C. The AI flags possible concerns, while the radiologist makes the final judgment.
- D. The AI is just a fancy printer

Correct Answer: C

Explanation: The classic decision-aid pattern: AI surfaces possibilities, clinician decides.

Q12 [Type: MCQ | Difficulty: Medium | QID : 52060]

A college basketball team uses AI to analyze video footage and produce statistics about player performance during games.

What kind of AI task is this?

- A.** The AI is performing pattern recognition on video — a common AI application in sports
- B.** The AI is generating new sports rules
- C.** The AI is replacing the entire coaching staff
- D.** The AI is randomly producing statistics

Correct Answer: A

Explanation: Pattern recognition applied to video is the standard sports analytics AI application

Q13 [Type: MCQ | Difficulty: Medium | QID : 52064]

Rank these from most clearly AI to least clearly AI.

- I. A digital alarm clock that displays the time
- II. A printed cookbook with recipes
- III. A voice assistant that responds to spoken questions
- IV. A photo app that automatically identifies your friends in pictures

Options:

- A. II → I → III → IV
- B. IV → III → II → I
- C. III → IV → I → II
- D. I → II → IV → III

Correct Answer:

- C. III → IV → I → II

Explanation:

- **III. A voice assistant** — Clear AI (speech recognition + natural language processing)
- **IV. A photo app identifying friends** — Clear AI (facial recognition)
- **I. A digital alarm clock** — Simple electronics, not AI
- **II. A printed cookbook** — Paper, not AI

AI systems perform tasks that typically require human intelligence, such as understanding speech and recognizing faces. Digital alarm clocks simply display time and do not learn or recognize anything. Printed cookbooks contain static information only.

Q14 [Type: MCQ Scenario | Difficulty: Medium | QID : 52070]

A student claims: "AI is going to replace teachers entirely within 5 years."

What is the most accurate response based on what AI can and cannot currently do?

- A. The student is correct
- B. AI will never affect teaching in any way
- C. AI is illegal in schools
- D. AI is changing parts of teaching, but human judgment and relationships still matter.

Correct Answer: D

Explanation: AI is changing tasks within teaching but hasn't replaced the relational core. Specific timeline predictions about "5 years" are speculation.

Q15 [Type: MCQ Scenario | Difficulty: Medium-Hard | QID : 52071]

A parent is concerned about AI being used in their child's school. They want to understand how to think about this.

Which framing is most useful?

- A. Schools should ban all AI to protect children
- B. Schools should use AI freely with no oversight
- C. Different AI uses raise different concerns, so schools should evaluate them carefully and involve stakeholders.
- D. AI in schools doesn't exist

Correct Answer: C

Explanation: "AI" isn't one thing — different uses raise different questions. The L4 framing asks specific questions, not category positions.

Q16 [Type: MCQ | Difficulty: Medium-Hard | QID : 52072]

A new student is learning about AI. Rank these understanding milestones from most to least foundational.

- I. Different AI systems have different capabilities and limitations
- II. AI logos use specific color schemes
- III. AI learns patterns from data rather than following hardcoded rules
- IV. AI today is mostly narrow AI designed for specific tasks

Options:

- A. III → IV → I → II
- B. IV → III → II → I
- C. I → III → IV → II
- D. II → I → III → IV

Correct Answer:

- A. III → IV → I → II

Explanation:

- **III. AI learns patterns from data rather than following hardcoded rules** – Most foundational because it explains what makes AI different from traditional programming
- **IV. AI today is mostly narrow AI designed for specific tasks** – Foundational understanding of AI's current scope
- **I. Different AI systems have different capabilities and limitations** – Operational understanding of how AI systems vary
- **II. AI logos use specific color schemes** – Irrelevant to understanding AI concepts

Understanding AI begins with knowing how AI works (learning patterns from data). Then comes understanding the scope of modern AI systems, followed by recognizing that different AI tools have different strengths and weaknesses. Logo aesthetics are unrelated to AI understanding.

Q17 [Type: FRQ - Short Answer | Difficulty: Hard]

A relative asks you: "I've heard a lot about AI lately. Is it going to take everyone's jobs?"

Explain how someone with AI literacy would respond more thoughtfully than a simple yes or no.

(Respond in 2–3 sentences.)

Model Answer: A thoughtful response would explain that AI is changing many jobs but the picture is more nuanced than wholesale replacement. AI is automating specific tasks within jobs (data analysis, drafting, scheduling, routine document review) more than replacing entire roles, and many jobs increasingly involve working with AI tools rather than being replaced by them. The bigger question isn't "will AI take jobs?" but "how will jobs change, who benefits from those changes, and how do workers and societies prepare for that transition?"

Q18 [Type: FRQ | Scenario Analysis | Difficulty: Hard]

A relative who works in healthcare is excited about AI being used in their hospital but is also worried about it. They ask: as someone who has just started learning about AI, what's one significant thing they should be excited about, and one significant thing they should be cautious about, in how AI is being used in healthcare today?

(Respond in 3–4 sentences.)

Model Answer: One significant thing to be excited about is that AI can help healthcare workers process large amounts of medical information faster — like analyzing imaging to flag possible diagnoses for review — potentially catching conditions earlier and freeing healthcare staff to spend more time on patient care rather than paperwork. One significant thing to be cautious about is that AI systems trained on data from certain populations can perform less accurately for others, and AI errors in healthcare can directly affect patient outcomes — so AI should support healthcare workers' clinical judgment rather than replace it. The hospital should treat AI as a powerful but imperfect tool, with humans in the loop where decisions affect patient care, and your relative should look for whether the hospital has practices for verifying AI outputs.

Q19 [Type: Meta-Question]

Which question in this quiz made you think the hardest or felt most interesting to you?

☐ Q1 ☐ Q2 ☐ Q3 ☐ Q4 ☐ Q5 ☐ Q6 ☐ Q7 ☐ Q8 ☐ Q9 ☐ Q10 ☐ Q11 ☐ Q12 ☐ Q13 ☐ Q14 ☐ Q15 ☐ Q16 ☐ Q17 ☐ Q18

Portal instruction: Selection required. Response logged to domain interest profile. Student sees question numbers only.
